

Quantitative Text Analysis – Essex Summer School

Dictionaries

dr. Martijn Schoonvelde

University of Groningen

Today's class

Categorize text:

- Pros and cons of using off-the-shelf dictionaries
- Considerations for developing a dictionary
- Lab session

Analysis

- Three broad types of analysis (Boumans & Trilling 2016), from most deductive to most inductive:
 - counting and dictionary methods: the researcher can fully specify relevant features, and will categorise text accordingly
 - **supervised methods**: the researcher knows how to **categorise documents**, and uses machine learning methods to learn which features drive this categorisation
 - unsupervised methods: the researcher uses qta tools to learn about textual categorisation inductively

Dictionary methods

- "Dictionaries use the rate at which key words appear in a text to classify documents into categories or to measure the extent to which documents belong to particular categories" (Grimmer & Stewart, 2013)
 - That is, count words associated with specific meanings
- Dictionaries consist of key-value pairs
 - Key: label for the concept or equivalence class
 - Values: (multiple) terms or patterns of terms that are declared equivalent occurrences of the key class

Dictionary methods

Under what conditions do dictionary methods excel? (Van Atteveldt et al. 2022)

- The categories that we want to code are manifest and concrete rather than latent and abstract
 - Abstract theoretical constructs such as frames or ideologies are difficult to capture using dictionaries
- All known synonyms are included in the dictionary
- Dictionary entries do not have multiple meanings

Dictionaries and the economy

Dictionary methods

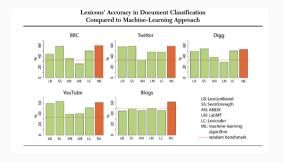

Key questions when applying dictionaries concern their validity, recall, and precision

- Validity does the dictionary meaningfully operationalize our concept of interest?
- Recall does the dictionary identify all relevant content?
- Precision does the dictionary identify only relevant content?

Source: https://lse-my459.github.io/

Dictionary methods

Off-the-shelf dictionaries have a bit of a bad reputation. For example, lots of research that shows that sentiment dictionaries vary in their performance across types of text

Source: González Bailón & Paltoglu 2015

Issues with off-the-shelf dictionary methods

Domain-specificity problem (Chan et al. 2020; see also Rauh, 2018; Rice & Zorn, 2019): dictionaries are often produced in one context and used in another. This may be problematic

- "honourable" in HoC speeches or irony more generally
- "love" and "bagel" in texts about tennis

Dictionaries ignore context

 Yet words can have multiple meanings (polysemous words) depending on how they are used in a sentence

False negatives

• How can we be certain that a dictionary has captured all relevant synonyms in a corpus?

English bias in dictionary construction – do they translate to other languages?

• But see Proksch et al. (2019)

Recent advancements

Recent studies have made progress on these issue by developing domain-specific dictionaries that rely on machine translation, word embeddings or extensive human coding (Müller, 2021; Proksch *et al.*, 2019; Rauh, 2018; Rheault *et al.*, 2016; van Atteveldt *et al.*, 2008; Widmann, 2021).

Also: joint modeling of topics and sentiment – Joint Sentiment Topic model (JST) and the reversed Joint Sentiment Topic model (rJST) (Lin *et al.*, 2009; Lin *et al.*, 2012).

NRC Word-Emotion Association Lexicon

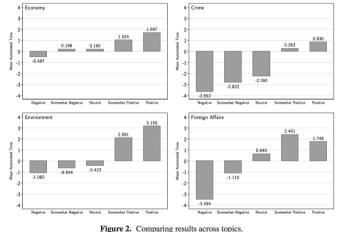

- Mohammad and Turney (2013)
- Annotation crowdsourced through Mechanical Turk
- NRC available through the package quanteda.sentiment
- Available in multiple languages

> summary(data_dictionary_NRC) Length Class Mode anger 1247 -none- character anticipation 839 -none- character 1058 disgust -none- character fear 1476 -none- character 689 -none- character jov 3324 negative -none- character 2312 positive -none- character sadness 1191 -none- character surprise 534 -none- character trust 1231 -none- character

Lexicoder Sentiment Dictionary

- Young and Soroka (2012)
- Valence dictionary, which builds on earlier dictionaries: Roget's Thesaurus, General Inquirer and the Regressive Image Dictionary
 - Positive: if + + + or if + + NA;
 - Negative if -- or if -- NA
 - For other words, contextual analysis through KWIC and other preprocessing steps to account for ambiguity
- 4567 positive and negative words
- Validated against 3 coders of 900 New York Times articles and other dictionaries

Lexicoder Sentiment Dictionary

• Trend in line with expectations – but levels differ across topics

LIWC

	LIWC		LIWC Cont.			
Category	Example	T-statistics	Category	Example	T-statistics	
Linguistics Processes			Negative emotion	hurt, ugly, nasty	6.49***

Humans	adult, baby, boy	0.89	Religion	church, altar	-0.77	
Affective process	happy, cry	3.55**	Death	bury, coffin	0.49	
Positive emotion	love, nice, sweet	0.08		,		

- Developed by James Pennebaker and colleagues
- Extensively validated on various corpora

Dictionary methods in quanteda

text3 1

• A dictionary in **quanteda** assigns possible features to categories, or "keys". It can have as many categories as you wish, and can be composed of any possible feature.

```
> txt_dfm <- corpus(c("this is excellent", "bad", "good, not horrible")) %%
tokens() %>% dfm()
> sent_dict <- dictionary(list(positive=c("great", "good", "excellent"),</pre>
                              negative=c("bad", "horrible", "badly")))
+
> dfm_dict <- dfm_lookup(txt_dfm, dictionary = sent_dict)</pre>
> dfm dict
Document-feature matrix of: 3 documents, 2 features (33.33% sparse) and 0 docvars
      features
docs positive negative
 text1 1
 text2
```

Sentiment dictionaries in quanteda

Through **quanteda.textmodels** you have access to a number of **off-the-shelf sentiment** dictionaries:

- Polarity dictionaries have two lists of words, each indicating one "pole" (by default "positive" and "negative")
- 'Valence dictionaries have continuous values/weights associated with each word in a given category, and may have more or fewer than two categories.

Name	Description	Polarity	Valence
data_dictionary_AFINN	Nielsen's (2011) 'new ANEW' valenced word list		~
data_dictionary_ANEW	Affective Norms for English Words (ANEW)		~
data_dictionary_geninqposneg	Augmented General Inquirer Positiv and Negativ dictionary	~	
data_dictionary_HuLiu	Positive and negative words from Hu and Liu (2004)	~	
$data_dictionary_LoughranMcDonald$	Loughran and McDonald Sentiment Word Lists	~	
data_dictionary_LSD2015	Lexicoder Sentiment Dictionary (2015)	~	
data_dictionary_NRC	NRC Word-Emotion Association Lexicon	~	
data_dictionary_Rauh	Rauh's German Political Sentiment Dictionary	~	
data_dictionary_sentiws	SentimentWortschatz (SentiWS)	~	~

Do's when using off-the-shelf dictionaries

- Read the dictionary
 - Domain-specific yes or no?
 - Change the dictionary if necessary but be transparent about it (i.e., report it)
- Try out on a subset of your corpus does it pick up on the construct you try to capture? And only your construct?
 - Assess specificity and sensitivity

Developing Dictionaries

- "When counting is automated, success or failure largely reflects a correct (excluding irrelevant data) and exhaustive (including all the relevant data)" (Boumans and Trilling 2016)
- As always, there is no silver bullet approach much depends on what construct the dictionary is supposed to capture

Developing Dictionaries

Van Atteveldt et al. (2022) propose the following workflow for constructing a dictionary:

- 1. Construct a dictionary based on theoretical considerations and by closely reading a sample of example texts.
- 2. Code some articles manually and compare with the automated coding.
- 3. Improve your dictionary and check again.
- 4. Manually code a validation dataset of sufficient size. The required size depends a bit on how balanced your data is if one code occurs very infrequently, you will need more data.
- 5. Calculate the agreement.
 - Precision and recall

Developing Dictionaries

- 1. Identify "extreme texts" with "known" categories / positions
 - Opposition leader and Prime Minister in a no-confidence debate
 - Five-star review of a product (excellent) and a one-star review (terrible)
- 2. Search for differentially occurring words using word frequencies
- 3. Examine these words in context to check their sensitivity and specificity
- 4. Examine inflected forms to see whether stemming or wildcarding is required
- 5. Use these words (or their lemmas) for categories

Source: https://lse-my459.github.io/

Assessing validity

Content validation

- Check sensitivity of results to exclusion of specific words.
- Disambiguate meaning. For example, check grammatical function of ambiguous words using POS tagging.

Concept validation

- Code a few documents manually and see if dictionary prediction aligns with human coding of document (check precision and recall)
- Check if categorisation behaves in predictable ways. For example, do newspaper articles
 about the economy peak during periods of economic uncertainty
